

Self aligning bearing units

One-piece cast stainless steel supports. They allow the load capacity of the built-in self-aligning bearings to be fully used.

Support tolerance:

- The measurement tolerance for machined surfaces is ± 0.25 mm.
- The seating tolerance of the bearing in the cast support has been set in such a way that the bearing adapts appropriately if the shaft presents misalignment.

The possibility of relubrication is provided for in almost all supports.
